## 7<sup>th</sup> Grade Advanced Math Parent Guide

In this unit students find lateral and total surface area along with volume. They will learn about parallel lines out by transversals and will write algebraic representations of transformations on accordinate gird. They will use the Pythagnean Theorem and its converse to solve problems.

Sturents vill see that lines and their conceponing angles one ateurique characteristics, that form las can be used to solve problems in olving suface area and volume. They will apply the Pythagnean Theorem as well as the note effects of transformations on a 2D figures and investigate how scale factor charges proportionality.

- Measurement is used in daily life and knowing how to find volume, surface area, common angles and how things transform on accordinate plane will be very useful in the future.

Surlerts will explore bivariate data to determine strength & significance of relationships between quantities and use scatter plots to analyze and make predictions about that data ta
